

Pipeline Management System — Project Status & Next Steps

Prepared for: CEO, Rozetta Institute

Date: 14 April 2026

Status: Version 1 Complete —
Pre-Deployment

1. What Has Been Built

Version 1 of the Rozetta PMS is fully built and running locally. All six planned phases have been completed. The system is a private, multi-user web application purpose-built for Rozetta's pipeline evaluation workflow.

Phase	What was built	Status
1 — Foundation	Database, backend API, Docker setup, authentication shell, frontend	✓ Complete
2 — Pipeline	Kanban board with drag-and-drop, list view, stage history with timestamps	✓ Complete
3 — Meetings	Meeting logger, attendee management, AI notetaker (Mode 1 — paste import)	✓ Complete
4 — Assessments	6-criteria scoring card (1–5), version history, Proceed/Park/Decline workflow	✓ Complete
5 — Search & Files	Full-text search, activity timeline per pitch, file path references	✓ Complete
6 — Reports	Dashboard metrics, pipeline summary, CSV export, print views, Phase 7 placeholder	✓ Complete

2. Current State

What works right now	Detail
Running locally	The application runs on one machine using Docker. All three services (database, backend, frontend) start with a single command.
Dev login	A built-in development login allows full Admin access for testing without Microsoft credentials.
Add / view pitches	Pitches can be created via the New Pitch form and managed through the Kanban pipeline board or list view.
Meetings & assessments	Meetings can be logged with attendees and notes. Assessments can be scored and versioned per pitch.
AI notetaker	Meeting notes can be pasted in and parsed into structured fields. Currently uses a mock parser — activates fully once a Claude API key is added.

Reports & export	Dashboard metrics, pipeline summary table, and CSV export for all 5 record types are working.
User guide	A full staff user guide (Word document) has been produced covering every feature.

3. What Is Needed to Go Live

Three things are required before the system can be used by the full Rozetta team. Each is a distinct step and they can be completed in any order, though hosting should be confirmed first.

Step 1 — Choose and Set Up Hosting

Currently the application only runs on one machine. To make it accessible to all Rozetta staff, it needs to be deployed to a server. Three options were scoped:

Option	Description	Est. Cost	Recommended
A — Private VPS	DigitalOcean, Hetzner, or AWS Lightsail. Full control, HTTPS, PostgreSQL hosted privately.	~\$15–30/mo	★ Yes
B — Internal server	Self-hosted on Rozetta's own infrastructure. Requires IT setup.	Minimal	If IT available
C — Managed cloud	Render, Railway, or Fly.io. Simpler to operate, comparable privacy.	~\$20–40/mo	Good fallback

Note: All options include HTTPS, login-required access, and full data export. Data sovereignty (Australian hosting) is available via AWS Sydney or Hetzner — confirm if this is a requirement.

Step 2 — Set Up Microsoft Azure AD Login

The system is built to authenticate staff via their existing @rozettainstitute.com Microsoft 365 accounts. No separate passwords or accounts are needed — staff click 'Sign in with Microsoft' and are in. To activate this, a Microsoft Azure AD application registration needs to be created. This is a one-time setup task that takes approximately 30 minutes and requires access to the Rozetta Microsoft 365 admin account.

What is needed	Who does it
Access to Azure Portal (portal.azure.com) as a Microsoft 365 admin	Rozetta IT contact or Microsoft 365 admin
Register a new application in Azure Active Directory	IT contact (step-by-step instructions can be provided)
Copy 3 values into the application's .env file: Client ID, Tenant ID, Client Secret	Developer / IT contact
Restart the application — Microsoft login activates automatically	No code changes required

Step 3 — Add Claude API Key (AI Notetaker)

The AI meeting note parser is fully built and working with a mock parser. To activate real AI parsing (which is significantly better at understanding unstructured meeting notes), an Anthropic Claude API key is required. This is optional for go-live — the mock parser works adequately for well-structured notes — but is recommended for the best experience.

What is needed	Detail
Anthropic Console account	Sign up at console.anthropic.com
API key	Generate a key in the Console — takes 2 minutes
Add to .env file	One line: ANTHROPIC_API_KEY=your-key-here
Cost	Pay-as-you-go — approximately \$0.01–0.05 per meeting note parsed

4. Phase 7 — Financial Reporting (Future Build)

The dashboard includes a clearly marked 'Coming Soon — Phase 7' section with three placeholder cards. These are reserved for a future build once the requirements are defined:

Placeholder	Description
Pipeline Financial Table	Bids by status: successful / under development / declined, with dollar amounts
Risk-Adjusted Income View	Probability-weighted expected income across the active pipeline
Impact Measurement View	To be defined — Rozetta's framework for measuring non-financial impact
